interfering with transcription of the RNA component, decreasing the half-
coliforucleotides can inhibiting the telomerase noloenzyme, or inhibiting the be
collymerase activity of telomerase. These antisense oligonucleotides can
cells in vivo. They can be used in therapeutics for treating or
cells in vivo. They can be used in therapeutics for treating or
cells in vivo. and for selectively down-regulating specific branches
confundancery theraptes or for treating infections by, e.g. yeast,
                                                                                                                                                                                                                                                                                                                                                                 - used for detecting
                                                                                                                                                                                                                                                                                                                                                                    New polynucleotide(s) anti:sense to human telomerase - used for detecting or inhibiting human telomerase, e.g. for treating cancers, contraception, immuno-suppression or treating infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RNA component; human telomerase; antisense oligonucleotide; infection; neuroblastoma; bladder cancer; colon cancer; prostate cancer; contraception; sterilisation; immunosuppression; therapeutic; hTR; immune system down-regulation; anti-inflammatory therapy; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ð
                                                                                                                                                                                                                                               Sequences shown in AAV41169 to AAV41181 represent antisense
oligonucleotides to the RNA component of human telomerase (hTR). These
antisense oligonucleotides specifically hybridise to a nucleotide
equence within an accessible region of the hTR, but that does not
hybridise to a sequence within the template region of hTR. These
component of human telomerase in a sample. This is useful for diagnosing
component of human telomerase in a sample. The inhibitory
and providing prognosis for a cancer patient. The inhibitory
and providing prognosis for a cancer patient. The inhibitory
cligonucleotides can inhibit the telomerase activity level in a cell by
interfering with transcription of the RNA component, decreasing the half-
life of the telomerase RNA component transcript, inhibiting assembly of
the RNA component into the telomerase holoenzyme, or inhibiting the
polymerase activity of telomerase activity in both cultured cells and in
cells in vivo. They can be used in therapeutics for treating or
preventing cancer, for contraception or sterilisation, for
immunosuppression, and for selectively down-regulating specific branches
of the immune system, e.g. a specific subset of T-cells, in anti-

```
Sequences shown in AAV41169 to AAV41181 represent antisense cliganuclectides to the RNA component of human telomerase (TTR). These cliganuclectides to the RNA component of human telomerase (TTR). These categorides within an accessible region of the hTR, but that does not hybridise to a sequence within the template region of hTR. These cliganuclectides may specifically be used for detection of an RNA component of human telomerase in a sample. This is useful for diagnosing cancer (especially neuroblastoma, bladder, colon and prostate cancer), and providing prognosis for a cancer patient. The inhibitory coligonuclectides can inhibit the telomerase activity level in a cell by interfering with transcription of the RNA component, decreasing the half-life of the telomerase RNA component transcript, inhibiting assembly of the RNA component into the telomerase. These antisense oligonuclectides can publicate the telomerase activity of telomerase. These antisense oligonuclectides can inhibiting telomerase activity in the collection of the RNA component into the telomerase activity in this collection of the RNA component into the telomerase activity of telomerase activity of telomerase activity of telomerase activity in the collection of the RNA component and in the collection of the RNA component and the RNA c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polynucleotide(s) anti:sense to human telomerase - used for detecting or inhibiting human telomerase, e.g. for treating cancers, contraception, immuno-suppression or treating infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cells in vivo. They can be used in therapeutics for treating or preventing cancer, for contraception or sterilisation, for immunosuppression, and for selectively down-regulating specific branches of the immune system, e.g. a specific subset of T-cells, in anti-inflammatory therapies or for treating infections by, e.g. yeast, parasites or fungi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Telomerase; human; immune response; cancer; vaccine; treatment; disease;

                                                                                                                                                                                                                                                                                        This invention describes a novel composition comprising human telomerase having at least 2000-fold (preferably at least 60000-fold) increased relative purity compared with crude extract of cells from adenovirustransformed kidney cell line. The composition is useful for eliciting an immune response in animals and may therefore be used as a vaccine for treating diseases associated with the overexpression of telomerase e.g. cancer. AAZ2105-C22031 represent oligonucleotides used in the isolation of human clone 28-1 which contains a fragment of the human telomerase described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Telomerase; human; immune response; cancer; vaccine; treatment; disease;

The invention relates to promoter regions from mouse and human telomerase RNA (TR) component genes. The TR gene promoter can be linked to a heterologous gene, especially a gene encoding a cytotoxin, for therapy of cancer, especially neoplasias. The telomerase is necessary for the unrestricted proliferative capacity of many human cancers. Mutation or dysregulation of the telomerase expression in cancer. Substances, or upregulation of telomerase expression in cancer. Substances, identified in the methods, can be used to block transcription from the TR gene promoter through interaction of the 5' regulatory sequences. These gubstances, e.g. antisense oligonucleotides, transcription factors, peptide nucleic acids and factors that disrupt signal transduction, are useful for cancer therapy. In particular, gene therapy vectors
                                                              This invention describes a novel composition comprising human telomerase having at least 2000-fold (preferably at least 6000-fold) increased relative purity compared with crude extract of cells from adenovirus-transformed kidney cell line. The composition is useful for eliciting an immune response in animals and may therefore be used as a vaccine for treating diseases associated with the overexpression of telomerase e.g. cancer. AAZ23626-Z23637 represent oligonucleotides used in the isolation of human clone 28-1 which contains a fragment of the human telomerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mouse and human telomerase RNA gene promoters, useful for tumor specific

RWA (TR) component genes. The TR gene promoter can be linked to a cancer. Substances, especially a gene encoding a cyctoxin, for therapy of cancer, especially neoplasiase. The telomerase is necessary for the unrestricted proliferative capacity of many human cancers. Mutation or dysregulation of the telomerase repression pathway may cause reactivation or upregulation of telomerase expression in cancer. Substances, cor upregulation of telomerase expression in cancer. Substances, con the methods, can be used to block transcription from the TR gene promoter through interaction of the 5' regulatory sequences. These substances, e.g. antisense oligomuclectides, transcription factors, ceptide nucleic acids and factors that disrupt signal transduction, are useful for cancer therapy. In particular, gene threapy vectors (especially pGT62-codAupp) comprising the promoter and a viral thymidine (substances can be used to convert a prodrug, e.g. gancyclovir, so that neoplasia can be controlled or treated Direct down-regulation of telomerase RNA gene through manipulation of transcription factors may be effective anticancer therapy and the cloning of the hTR gene promoter
                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to promoter regions from mouse and human telomerase
(especially pGT62-codAupp) comprising the promoter and a viral thymidine kinase gene can be used to convert a prodrug, e.g. gancyclovir, so that neoplasia can be controlled or treated. Direct down-regulation of tendencese RNA gene through manipulation of transcription factors may be effective anticancer therapy and the cloning of the hTR gene promoter allows the analysis of therapeutic molecules which modulate hTR promoter activity. Sequences AAA2072696-321 represent PCR primers used in cloning
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mouse and human telomerase RNA gene promoters, useful for tumor specific
                                                                                                                                                                                                                                                                                  Gaps

Telomerase is a ribonucleoprotein enzyme that synthesizes one strand of the telomeric DNA, using as a template an incledite sequence contained within the RNA component of the enzyme. The nuclectide sequence contained within the RNA component of the enzyme. The bases, which include the sequence GTTAGG. The uncharged nature of the PNA backbone increases the melting temperature of associating strands, increases the rate of association with targeted nucleic acids, and affords greater resistance of degradation by proteases or nucleases. The therapeutic PNAs may be used for treating disease conditions such as cancers, neoplasia, hyperplasia, neurodegenerative diseases, aging, human immunodeficiency virus (HTV) infection/AIDS (acquired immunodeficiency syndrome) and associated pathologies, fungal infections, and other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New peptide nucleic acid (PNA) compounds that inhibit telomerase activity in mammalian cells is useful as probes to detect the RNA component of a mammalian telomerase.
allows the analysis of therapeutic molecules which modulate hTR promoter activity. Sequences AA207623-80 represents PCR primers for amplifying human TR gene (hTR) promoter sequence

diseases characterized by abnormal telomere metabolism or telomerase activity, in combination with antineoplastic and other cyctotoxic or cytostatic agents, antifungal agents, and other nucleotides. PNAs may be used for molecular diagnostics, labelled PNAs are used as hybridization probes to detect or quantitate polynucleotides having a human telomerase RNA fhTR) sequence. PNA probes are also used for forensic identification of individuals, e.g. paternity testing, based on hTR gene restriction fragment length polymorphism (RFLP) pattern. PNAs are also useful as probes to detect the RNA component of a mammalian telomerase and as inhibitors of telomerase activity. The method of the present invention allows cancerous conditions to be detected with increased confidence and possibly at an earlier stage, before cells are detected as cancerous based on pathological characteristics. The diagnostic and prognostic methods of the present invention can be used to detect an immortal or neoplastic cell or tumour tissue or cancer of any origin, provided the cell expresses telomerase activity and its RNA component
                                                                                                                                                                                                                                                                                                                                                                                   ;

The present invention relates to peptide nucleic acids (PNAs), comprising a sequence of 6-25 nucleobases, that inhibit telomerase activity in mammalian cells by hybridising to the RNA component of mammalian cells by hybridising to the RNA component of mammalian cells by hybridising to the RNA component of mammalian telomerase and as inhibitors of telomerase activity, or to detect and/or quantitate polymucleotide having the human telomerase RNA component (hTR) sequence, as well as in forensic identification of individuals, such as paternity testing or identification of criminal cuspects or unknown descendants based on the hTR gene RFLP pattern. The PNA can be further used for treating or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or neurodegenerative diseases. The PNAs in combination with other pharmacceuticals (such as antineoplastic or cytostatic agents) can be used for treating neoplast, hyperplasia, human immunodeficiency virus (HIV) infections, acquired inmunodeficiency synchome (AIDS) and associated pathologies, and other diseases characterised by abnormal telomera metabolism or telomerase cutivity. The present sequence represents one of the PNA sequences of the

The invention relates to polynucleotide inhibitors (I) and methods for inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity and proliferation of a telomerase positive cell, and in manifacturing a medicament for inhibiting telomerase activity in a cill mand in treating telomerase-mediated condition or disease, such as adenocarcinoma of breast, prostate or colon, mixed cell leukaemia, Hodgkin's disease, fertility and inflammatory conditions. (I) are also useful in treating a tumour or in manufacturing a medicament for the treatment of tumour. The polynucleotide inhibitors may also be used in diagnostic assays for detecting RNA or DNA. Inhibition of telomerase cativity in cells in vivo is useful in prophylactic and therapeutic methods of treating cancer and other disorders involving inappropriate expression of telomerase, and in treating veterinary proliferative for immunosuppression and for selectively down-regulating specific for immunosuppression and for selectively down-regulating specific branches of the immune system. The present sequence represents human telomerase polynucleotide inhibitor #15, as described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The sequence represents an antisense oligonucleotide used in the purification of human telomerase. The invention relates to a purified human telomerase. The invention relates to a purified human telomerase core enzyme protein comprising 2000-fold increased than the compared with a crude extract of cells from adenovirus-transformed purity compared with a crude activity and a molecular weight of 200-2000 kidney cell line (293 cells) and when associated with telomerase RNA component has DNA polymerase activity and a molecular weight of 200-2000 kilo Daltons (KDa). The purified telomerase is useful for inducing a humoral or cell-mediated immune response in an animal. Purified ciscases associated with over-expression of telomerase, such as cancer and for producing antibodies that recognize telomerase, which are useful as affinity agents in isolating the proteins and for detecting the proteins in a sample, such as cell or tissue. Identification of telomerase aids in diagnosis of cancer or pre-cancerous states.

Telomerase and/or telomerase associated proteins are also useful for screening compounds to identify agents that alter the association of telomerase associated proteins, such as nucleolin or EF2H with telomerase
                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence represents a biotinylated antisense oligonucleotide used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Purified human telomerase, useful for inducing immune response in animals, comprises several thousand folds increased purity compared with

the purification of human telomerase. The invention relates to a purified human telomerase core enzyme protein comprising 2000-fold increased purity compared with a crude extract of cells from ademovinus-transformed kidney cell line (293 cells) and when associated with telomerase RNA component has DNA polymerase activity and a molecular weight of 200-2000 kilo Daltons (KDa). The purified telomerase is useful for inducing a humoral or cell-mediated immune response in an animal. Purified telomerase or immunogenic fragments are useful as vaccines for treating telomerase or immunogenic fragments are useful as vaccines for treating diseases associated with over-expression of telomerase, which are useful as affinity agents in isolating the proteins and for detecting the presence of proteins in a sample, such as cell or tissue. Identification of telomerase and/or telomerase associated proteins are also useful for screening compounds to identify agents that alter the association of telomerase associated proteins are also useful for screening compounds to identify agents that alter the association of telomerase associated proteins are also well for screening compounds to identify agents that alter the association of telomerase.
                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides a method for inhibiting or reducing the growth of a cell which involves administering to the cell a telomere damage inducing agent and a telomerase inhibitory agent. This can be used in the treatment of aberrant cell growth, including cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                growth of cell for treating cancer, comprising damage-inducing agent and telomerase inhibitory

This represents an antisense oligonucleotide to the RNA component of human telomerase (hTR). The invention relates to an activator-antisense complex that comprises: (a) an antisense oligonucleotide, complementary comprises: (a) an antisense oligonucleotide, complementary to a 12-25 nucleotide portion of hTR, with a hydroxyl moiety at the first complex and (b) a linker attached to the first end, and (c) an activator of RMsse L attached to the linker. The activator-antisense complex may be used for inhibiting the growth of a telomerase-expressing malignant cells or tumour. The complex is used to specifically cleave the ribonucleotide or tumour, renal cell cancer, mean and prostate cancer. Many other tumour, renal cell cancer, mean and prostate cancer. Many other canner and chronic leukemias, polychemia vera, Hodgkin's and non-Hodgkin's lymphomas, multiple myeloma, Waldenstrom's macroglobulinemia, Hodgkin's lymphomas and solid tumours, including numerous sarcomas and carcinomas. The complex is preferably administered in combination with a chemotherapeutic agent, particularly either displatin, doxornation with a chemotherapeutic agent, particularly either displatin, doxornation with

Sequences shown in AAV41169 to AAV41181 represent antisense
cligonucleotides to the RNA component of human telomerase (hTR). These
antisense cligonucleotides specifically hybridise to a nucleotide
sequence within an accessible region of the hTR, but that does not
hybridise to a sequence within the template region of hTR. These
cligonucleotides may specifically be used for detection of an RNA
component of human telomerase in a sample. This is useful for diagnosing
cancer (especially neuroblastoma, bladder, colon and prostate cancer),
and providing prognosis for a cancer patient. The inhibitory
coligonucleotides can inhibit the telomerase activity level in a cell by
interfering with transcription of the RNA component, decreasing the half-
ci life of the telomerase RNA component transcript, inhibiting assembly of
the RNA component into the telomerase holeonizyme, or inhibiting the polymerase activity of telomerase. These antisense oligonucleotides can
be used for inhibiting telomerase activity in both cultured cells and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polynucleotide(s) anti:sense to human telomerase - used for detecting or inhibiting human telomerase, e.g. for treating cancers, contraception, immuno-suppression or treating infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cells in vivo. They can be used in therapeutics for treating or preventing cancer, for contraception or sterilisation, for immunosuppression, and for selectively down-regulating specific branches of the immune system, e.g. a specific subset of T-cells, in anti-
                                                                                                                                                                                                                                                                RNA component; human telomerase; antisense oligonucleotide; infection; neuroblastoma; bladder cancer; colon cancer; prostate cancer; cancer; contraception; sterilisation; immunosuppression; therapeutic; hTR; immune system down-regulation; anti-inflammatory therapy; ss.

The present sequence represents a telomerase target sequence. The invention relates to an antisense oligonucleotide used as a control sequence alongside a peptide nucleic acid molecule which hybridises to the mammalian telomerase, and inhibits telomerase activity. Telomerase is a ribonucleoprotein enzyme that synthesizes one atraint to the telomeratic DNA, using as a template an il nucleotide contained within the RNA component of the enzyme. The invention capture contained within the RNA encepance of rownponent of the enzyme. The invention contained within the RNA encepance of the sequence of rownponent of the enzyme. The invention contained within the RNA component of the enzyme. The invention contained streams the melting temperature of associating strands, backbone increases the melting temperature of associating strands, controlled spreadation with targeted nucleic acids, and affords greater resistance of degradation by proceases or nucleases. The theorem is neoplasia, hyperplasia, neurodegenerative diseases, aging, human cancers, neoplasia, hyperplasia, neurodegenerative diseases, aging, human immunodeficiency virus (HIV) infection/AIDS (acquired immunodeficiency syndrome) and associated pathologies, fungal infections, and other cytotoxic diseases characterized by abnormal telomerase activity, in combination with antineoplastic and other cytotoxic cytostatic agents, antifungal agents, and other nucleotides. PNAs may be used for molecular diagnostics, labelled by and seed on the present individuals, e.g. paternity testing, based on hTR gene restriction fragment length polymorphism (RFLP) pattern. PNAs are also useful as probes to detect the RNA component of a mammalian telomerase and as inhibitors of telomerase activity. The method of the present invention allows the control of the present invention allows.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New peptide nucleic acid (PNA) compounds that inhibit telomerase activity in mammalian cells is useful as probes to detect the RNA component of a

The present sequence represents an antisense polyamide nucleic acid (PNA)), which is covalently linked to a RNase Lactivator moiety. The oligonuclectide is used in the method of the invention. The specification describes a method of cleaving a specific linvention. The specification describes a method of cleaving a specific RNA, optionally contained within a cell. The method comprises hybridising the RNA with a chimeric molecule of antisense PNA and RNAse L activator molecule is useful for treating Respiratory Syncytial Virus infection, inhibiting tumour growth, treating viral infection (e.g. human immunodeficiency virus (HIV)), autosomal dominant diseases caused by a mutant gene, chronic myelogenous leukemias, and crohns disease and other inflammatory conditions. It is also useful for sequence-specific inhibition of a targeted mRNA in order to effectively knock out the associated gene as an aid to elucidating the function of the encoded

The present invention relates to peptide nucleic acids (PNAs), comprising a sequence of 6-25 nucleobases, that inhibit telomerase activity in nammalian cells by Mybridising to the RNA component of mammalian cells by Mybridising to the RNA component of mammalian telomerase and as inhibitors of telomerase activity, or to detect and/or quantitate polymucleotide having the human telomerase RNA component (hTR) sequence, as well as in forensic identification of individuals, such as paternity testing or identification of criminal suspects or unknown descendants based on the hTR gene RFLP patern. The PNAs can be further used for treating or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or neurodegenerative diseases, the PNAs in combination with other pharmaceuticals (such as antineoplastic or cytostatic agents) can be used for treating neoplasia, hyperplasia, human immunodeficiency virus (HIV) infections, acquired immunodeficiency syndrome (AIDS) and associated pathologies, and other diseases characterised by abnormal telomerase metabolism or telomerase activity. The present sequence repersenting hTR RNA strand #3 is used to test the inhibition of telomerase activity by the PNAs of the present
                                                                                                                                                                                                                                                         Mammalian, forensic, paternity testing, human telomerase RNA component, hTR gene RFLP pattern, cancer, inflammation; lymphoproliferative disease; autofimmune disease, neurodegenerative disease, neoplasia; hyperplasia; HIV, AIDS; human immunodeficiency virus; telomere metabolism; cytostatic; acquired immunodeficiency syndrome; anti-inflammatory; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and genemapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TERC-targeted double-stranded siNA, which is identical to the c-fos transcript target sequence.
                                                                                             Human TERC transcript target sequence/siNA upper strand, SEQ ID 20.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New short interfering nucleic acid downregulates expression of the telomerase gene useful e.g. for treatment and diagnosis of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 3; SEQ ID NO 20; 145pp; English.

The siNAs may or may comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and

 used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TERC-targeted double-stranded siNA, which is identical to the c-fos transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; siNA; oble-stranded RNA; mirro-RNA; miRNA; short hairpin RNA; siRNA; compression modulation; gene therapy; short hairpin RNA; shRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense
                                                                                                                                                                                                                                                                                           Gaps

cc regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short contrained that sinAs include short hairpin RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short chairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised.

CC expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are consed to omboliate expression of the telomerase genes in cells, tissue consed to omboliate expression of the telomerase genes in cells, tissue consed for treating cancer, restencist, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, consed for treating cancer, restencist, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, consed for understand referencies, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene corresponded to the correspondence of a human TERC-teargeted double-stranded correspondence in Na which is identical to the correspondence of a human TERC-teargeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cytostatic, vasotropic, protozoacide, immunosuppressive; dermatological, auturoprotective, anti-HIV; ophthalmological; antiulcer, antirheumatic; antiantitic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shray, expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA connergulate expression of the one or more telomerase genes by RNA connergulate expression of may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense could be stranded. They further comprise sense and antisense con antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain a vertor or enzymatically synthesised. The invention also capressed from a vector or enzymatically synthesised. The invention also captes to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are captained or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be conditions to the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, lupus erythematosus, ALDS, macular degeneration, and gene constition and validation, genetic engineering, pharmacogenomics, studying gene function, and gene constition and sent sequence constition and sent sequ

The invention relates to short interfering nucleic acids (sinA) which downregulate expression of the one or more telomerase genes by RNA interference. The sinAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antiense regions, or alternatively are assembled from a sense oligonucleotide and an arisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telemerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematchosus, AIDS, macular degeneration, skin ulcers and rheumatchid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, suddying gene function, and gene mapping (e.g., of single nuclecide polymorphisms). The present sequence represents the lower strand of a human TERC-targeted double-stranded New short interfering nucleic acid downregulates expression of the telomerase gene useful e.g. for treatment and diagnosis of cancer.                                                                                                                                                                                                                                                                                                                                                     The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA commerced interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense of digonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue capinates for the treatment of a variety of conditions. They may be transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, informance or age-related diseases, e.g. multiple sclerosis, lugues erythematosus, AIDS, macular degeneration, sin dagnosis, therapeutic target identification and validation, shin ulcers and rheumatoid arthritis. The siNAs are also useful for drug capine: the upper strand of a human TERC-targeted double-stranded capines tranded of a human TERC-targeted double-stranded condition, which is identical to the c-fos transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The invention relates to short interfering nucleic acids (siNh) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double stranded RNA, micro-RNA (miRNA) and short can contain deoxyribonucleotides, and can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised.

CC expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vitro of in vitro of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in calls, tissue cyprosace to conganisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AlDS, macular degeneration, skin ulcers and rheumatoid architis. The sinks are also useful for drug coreening, diagnosis, lupus erythematosus, AlDS, macular degeneration, careening, diagnosis, laberatic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence consents the upper strand of a human TERC-targeted double-stranded sina, which is identical to the represent strand of a human TERC-targeted double-stranded sina.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

```

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonuclectide and an interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised, captessed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue captants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus exthematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TERC-targeted double-stranded which is identical to the c-fos transcript target sequence.

Example 3; SEQ ID NO 17; 145pp; English.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA controlled and and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised. Expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue used to modulate expression of the telomerase genes in cells, tissue transplants or roganisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically

The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiartritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short interfering syr, ene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.
e.g. multiple sclerosis, lupus erytnematosus, Allo, Machine construction and rheumatoid arthritis. The slMAs are also useful for drug screening, diagnosis, therapeutic taget identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TERC-targeted double-stranded siNA, which is identical to the c-fos transcript target sequence.
                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human TERC transcript target sequence/siNA upper strand, SEQ ID 31,

expressed from a vector or enzymatically synthesised, relates to kits for the in vivo delivery of sink, conjugates and/or complexes of sink, and vectors that expressed. The invention also relates to kits for the in vivo or in vivo delivery of sink, conjugates and/or complexes of sink, and vectors that express sink. The sinks are used to modulate expression of the telomerase genes in cells, tissue explaints or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, c.g. multiple sclerosis, lupus erythematosus, ALDS, macular degeneration, skin ulcers and rheumatoid arthritis. The sinks are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence mapping (e.g., of single nucleotide polymorphisms). The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antianfilammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering nucleic acid; siNA; mirro-RNA; mirro-RNA; shrNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.
hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified,

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised. expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express in cells, tissue cused to modulate expression of the telomerase genes in cells, tissue cused to modulate expression of the telomerase genes in cells, tissue cused to recaming (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisme). The present sequence represents the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise sense and antisense of interference. The siNAs may or may not comprise sense and antisense regions, or alternatively are assembled from a sense onigonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short contrain decayribonucleotides, and can be unmodified or chemically modified. Can contain decayribonucleotides, and can be chemically synthesised, can contain decayribonucleotides, and can be chemically synthesised, can contain decayribonucleotides, and can be chemically synthesised. Can complexes of siNA; and vectors that express fine invention also relates to kits for the in vitro or in vitro delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treatment or a variety of conditions. They may be used for treatment rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug sortenting, diagnosis, lharapeutic carget identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence corpused the capared and contains and the capared and contains and sense of a human TRRC-targeted double-stranded and sequence and which is identical to the capared and contains and sense and some contains and sense and sequence and sequence mapping (e.g., of single nucleotide polymorphisms). The present sequence and success the contains and sense and some contains and sense and some contains and sense and some contains and sense and contains and sense contains and sense contains and sense co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antialcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; slNA; short interfering RNA; double-stranded RNA; micro-RNA; miRNA; short halpin RNA; shRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                          New short interfering nucleic acid downregulates expression of the telomerase gene useful e.g. for treatment and diagnosis of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   siNA, which is identical to the c-fos transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonuclectide and an trisense oligonuclectide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short harpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically modified, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates cand/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically contozoal), transplant rejection, or autoimmune or age-related diseases, e.g. e.g. multiple sclerosis, lubus erythematosus, ADS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                  New short interfering nucleic acid downregulates expression of the telomerase gene useful e.g. for treatment and diagnosis of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  4.2%; Score 19; DB 1; Length 19; 100.0%; Pred. The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense or regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short can contain deoxyribonucleotides, and can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised. The invention also relates to kits for the in vitro of in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for trearging cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases. Sin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, lupus erythematosus, AIDS, macular degeneration, genetic engineering, pharmacogenomics, studying gene function, and gene cappands (e.g., of single nucleotide polymorphisms). The present sequence mapping (e.g., of single nucleotide polymorphisms). The present sequence the single of the single cargeded cappands of the single cappends of the single cappered cappands of the single cappered cappands of the single polymorphisms). The present sequence cappands of the single cappands of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA comparisons. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense coligonucleotide. Specifically, the siNAs include short interfering RNA (shRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised. Complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in calls, tissue candor complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in calls, tissue captants or organisms (e.g., by ex vivo gene therapy), or in grafts and cransplants for the treatment of a variety of conditions. They may be used for treatming cancer, restenosis, induces genes in calls, degeneration, processed in ulcers and rheumatoid arthritis. These macular degeneration, skin ulcers and rheumatoid arthritis. The present sequence captenesing, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TERC-target educated considering.

The invention relates to short interfering nucleic acids (sINA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised. Can contain deoxyribonucleotides, and can be chemically synthesised. Can complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue cand/or complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue cand/or complexes of siNA, and vectors that express siNA. The siNAs are used to roganisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically concount or and transplant rejection, or autoimmune or age-related diseases. Can multiple sclerosis, lupus erythematesus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation,

The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA mirRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also

                   and/or complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therappy, or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoinmune or age-related diseases, e.g. multiple sclerosis, lupus expthematosus, AIDS, macular degeneration skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthitic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; double-stranded RNA; micro-RNA; miRNA; short lainjin RNA; shrNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.
relates to kits for the in vitro or in vivo delivery of siNA; conjugates

CC The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (shRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (shRNA). The siNAs can be unmodified or chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. Complexes of siNA; and vectors that express since link, inconjugates and/or complexes of siNA; and vectors that express in cells, tissue used to modulate expression of the telomerase genes in cells, tissue cused to modulate expression of the telomerase genes in cells, tissue cused to modulate spression of the telomerase genes in cells, tissue cused to modulate spression of the vivo gene therapy), or in grafts and creating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, cused for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases. Cused for ulcers and rheumatoid arthritis. The sinAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, shin ulcers and rheumatoid arthritis. The sinAs are also useful for drug screening, diagnosis, therapeutic playing gene function and validation, wapping (e.g., of single nucleotide polymorphisms). The present sequence ceptores tepresents the upper strand of a human TERC-targeted double-stranded cusples and related to the c-fos transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise shonclectides and may be double or single stranded. They further comprise sense and mathense regions, or alternatively are assembled from a sense oligonuclectide and an artisense oligonuclectide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised. Can contain deoxyribonuclectides, and can be chemically sinhesised, can contain a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are cused to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular despenaration, skin ulcers and rheumatoid arthritis. The siMAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, appending engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shrNA; expression medulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; 88.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to short interfering nucleic acids (siNh) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonuclectide and an antisense oligonuclectide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue caplants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapebutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence mapping (e.g., of single nucleotide polymorphisms). The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ..

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonuclectide and an antisense oligonuclectide. Specifically, the siNAs include short hairpin RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised. Septement of the invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue transplants for the treatment of a variety of conditions. They may be transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infections diseases (specifically conditions).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New short interfering nucleic acid downregulates expression of the telomerase gene useful e.g. for treatment and diagnosis of cancer.

```

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense or regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double stranded RNA, micro-RNA (miRNA) and short can contain deoxyribonucleotides, and can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can complexes of siNA; and vectors that express sinh. The siNAs are used to modulate expression of the telomerase genes in cells, tissue cexplants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically proteozoal), transplant rejection, or autoimmune or age-related diseases, es multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug certening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence contains the lower strand of a human TERC-targeted double-stranded

New short interfering nucleic acid downregulates expression of the telomerase gene useful e.g. for treatment and diagnosis of cancer.

Example 3; SEQ ID NO 283; 145pp; English.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonuclectide and an interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised. Concaptessed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA, and vectors that express siNA. The siNAs are used to modilate expression of the telahomerase genes in cells, issue to replace to respension of the telahomerase genes in cells, issue carplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus extrhematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapputic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human TERC-targeted double-stranded

explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TERC-targeted double-stranded siNA, which is identical to the c-fos transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; sinA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shrap, expression medulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA be sinka may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, expressed from a vector or enzymatically synthesised, the invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shrNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and antisense oligonucleotide. Specifically, the sings include short interfering RNA (sirRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (sirRNA). The sinAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, and vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of sinA, conjugates and vector or shank, and vectors that express sin calls, tissue used to modulate expression of the telomerase genes in calls, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and used for treating cancer, restencesis, infectious diseases (specifically protozoal), transplant rejection, or autoimmume or age-related diseases, used for treating cancer, restencesis, infectious diseases (specifically skin ulcers and rheumatoid arthritis. The sinAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TERC-targeted double-stranded sinA, which is identical to the c-fos transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering ucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense of ligonuclectide. Specifically, the siNAs include short interfering RNA (shRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (shRNA). The siNAs can be unmodified or chemically synthesised, can contain deoxyribonuclectides, and can be chemically synthesised, can contain deoxyribonuclectides, and can be chemically synthesised, can contain deoxyribonuclectides, and can be chemically synthesised, can complaxes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue candor complaxes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue caplants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases. Ce.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The sinAs are also useful for drug careering, pharmacogenomics, strudying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence ceptors is indentical to the c-foe transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; snot interference; short interfering nucleic acid; slNA; short interfering RNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shrNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    g
                                                                                                                                                                                                                                                                    The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise sense and antisense coligonaclectide. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA, and vectors that express sinA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer restenosis, infectious diseases (specifically, protozoal), transplant rejection, or autoimmune or age-related diseases, sin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic empaping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TERC-targeted double-stranded siNA, which is identical to the c-fos transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short contribering RNA (siRNA). double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically spothesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can complexes of siNA; and vectors that express in relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue caplants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug correnning, diagnosis, lupus erythematosus, AIDS, macular degeneration, cannot in genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence consumption of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribourcleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an intisense oligonucleotide. Specifically, the siNAs include short hairpin RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, and/or complexes of siNA, and vectors that express siNA. The siNAs are and/or complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue caplants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for trasting cancer, restenosis, infectious diseases (specifically printiple sclerosis, lupus erythematosus, AlbS, macular degeneration, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AlbS, macular degeneration, cancer and validation, cancer in calls, therappate identification and validation, cancer in caper in calls.

```
The invention relates to short interfering nucleic acids (sinA) which downregulate expression of the one or more telomerase genes by RNA downregulate expression of the one or more telomerase genes by RNA be double or single stranded. They further comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and antisense oligonucleotide. Specifically, the sinAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The sinAs can be unmodified or charmacontain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protected).

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonuclectide and an antisense oligonuclectide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised. Expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue used to modulate expression of the telomerase genes in cells, tissue transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically

protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, ALDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene rapping e.g., of single nucleoride polymorphisms). The present sequence represents the upper strand of a human TERC-targeted double-stranded siNA, which is identical to the c-fos transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short

interfering RNA (BIRNA), double-stranded RNA, micro-RNA (miRNA) and short hairin RNA (BhRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNas are used to modulate expression of the telomerase genes in cells, tissue capants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restencies, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, ce.g. multiple sclerosis, lupus erythematosus AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short interfering RNA; siRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.
                                                                                                                                                                                                                                                                                       genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TERC-targeted double-stranded

New short interfering nucleic acid downregulates expression of the

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA convergulate expression of the one or more telomerase genes by RNA convergulate expression of the one or more telomerase genes by RNA convergence. The siNAs may or may not comprise sense and antisense coligonaclectide. They further comprise sense and antisense coligonaclectides, Specifically, the siNAs include and antisense oligonaclectides, Specifically, the siNAs include short interfering RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised. The invention also expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express sinA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue cused to modulate expression of the telomerase genes in cells, tissue cused to modulate expression of the telomerase genes in cells, tissue cused to modulate expression of the vivo gene therapy), or in grafts and transplants for every expressed in cells, tissue cused for treatenne or age-related diseases. Every in ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, so mapping (e.g., of single nuclectide polymorphisms). The present sequence crepresents the upper strand of a human TERC-targeted double-stranded cush, which is identical to the c-fos transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cytostatic, vasotropic, protozoacide, immunosuppressive, dermatological, neuroprotective, anti-HIV, ophthalmological; antiulcer, antirheumatic,

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA characterace. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense oligonacleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (siRNA). The siNAs can be unmodified or chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, a rautoimmune or age-related diseases, e.g. multiple sclerosis, lugue erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug correcting, diagnosis, therapeutic target identification and validation, screening, diagnosis, therapeutic target identification and validation, caption or sind, which is identical to the c-fost transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering uncleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

the inversious traders to short interferring fluctures delicated by RNA communications. The single stranded. They further comprise sense and antisense interference. The single stranded. They further comprise sense and antisense condule or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and antisense oligonucleotides. Specifically, the single include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short can contain deoxyribonucleotides, and can be chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised. Contains a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of single secondary complexes of single, by ex vivo gene therapy), or in grafts and cransplants for the treatment of a variety of conditions. They may be completed for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, conditions and rheumatoid arthritis. The sinks are also useful for drug screening, diagnosis, therapeutic target identification and validation, conspining (e.g., of single mucleotide polymorphisms). The present sequence conspining the upper strand of a human TERC-targeted double-stranded construction and validation, conspining, which is identical to the c-foe transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense colligonacleotide. Specifically, the siNAs include short interfering RNA (shRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and example for treatment of a variety of conditions. They may be used for treatment of a variety of conditions. They may be used for treatment expenses; inpute erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, spentic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TERC-targeted double-stranded crepted by which is identical to the c-fos transcript target sequence.

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonuclectide and an interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised. Can contain deoxyribonuclectides, and can be chemically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue cused to modulate expression of the telomerase genes in cells, tissue cused to modulate expression of the telomerase genes in cells, tissue camplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically crotozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug soreening, diagnosis, therapeutic target identification and sone mapping (e.g., of single nucleotide polymorphisms). The present sequence mapping (e.g., of single nucleotide polymorphisms). The present extranded contained the sequence contained the upper strand of a human TRRC-targeted double-etranded diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   siNA, which is identical to the c-fos transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 19;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 19 BP; 5 A; 8 C; 4 G; 0 T; 2 U; 0 Other;

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue used to modulate expression of the telomerase genes in cells, tissue transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically cortozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, ekin ulcers and rheumatoid arthritis. The siNAs are also useful for drug

The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antiennse regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised,
            genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 vasotropic; protozoacide; immunosuppressive; dermatological;

expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of sinA; conjugates and/or complexes of sinA, and vectors that express sinA. The sinAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restencesis, infections diseases (e.g. multiple sclerosis, invertice of conditions. They may be protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siMAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; pene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA; couble-stranded RNA; micro-RNA; miRNA; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

Example 3; SEQ ID NO 278; 145pp; English.

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an interfering RNA (siNAA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (siNAA). Adouble-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised.

Expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                  used for treating cancer, restenosis, infectious diseases (apportitally protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, appendix engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological;

                                                                                                                                                                                  The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAB may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense origonucleotide. Specifically, the siNAS include short interfering RNA (siRNA), double-stranded from a sense oligonucleotide and contain deoxyribonucleotides, and can be themically synthesised.

CC an contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised.

CC an contain deoxyribonucleotides, and can be chemically synthesised.

CC an obtain RNA (siRNA). The siNAS can be unmodified or chemically modified, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are cused to modulate expression of the telomerase genes in cells, tissue cused to modulate expression of the telomerase genes in cells, tissue cused to readening (e.g., by ex vivo gene therapy), or in grafts and cranaplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, inputs erythematosus, finds are also useful for drug screening, diagnosis, therapeutic target identification and validation, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, and gene companing (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TERCATEGET double-stranded company of the c-fos transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The inversion between the one or more telomerase genes by Nun. Computed and control stands (stranded They further comprise sense and antisense regions, or alternatively are assembled from a sense onlique stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siNAA), double-stranded RNA, micro-RNA (miRNA) and short can contain deoxyribonucleotides, and can be chemically synthesised, can complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue cand/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue carpaisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be concerned to the treatment of a variety of conditions. They may be concerned to the treatment of a variety of conditions. They may be concerned to the treatment of a variety of conditions. They may be concerned to the treatment of a variety of conditions. They may be concerned to the treatment of a variety of conditions of secreening dependence of single mucleotide polymorphisms). The present sequence can mapping (e.g., of single mucleotide polymorphisms). The present sequence concerned the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering conclet acid; siNA; short hairpin RNA; shRNA; expression modulation; gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to short interfering nucleic acids (siNA) which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New short interfering nucleic acid downregulates expression of the telomerase gene useful e.g. for treatment and diagnosis of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         11-MAR-2002;
                                                                                                                                                                                                                                                                                                                                                                                         28-AUG-2003
The invention relates to short interfering nucleic acids (siNA) which downtregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in calls, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and trensplants for the treatment of a variety of conditions. They may be used for treating cancer, restenoisis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lubus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthities. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, agenetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, can condulate expression of the telomerase genes in cells, tissue and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue candot the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically proteoxoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AlbS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, expresents the upper strand of a human TERC-targeted dubble extremeded mapping (e.g., of single nucleotide polymorphisms). The present extranded mapping (e.g., of single nucleotide polymorphisms). The present sequence extranded dependence and rheumatoid a human TERC-targeted dubble extranded degeneration and sense extranded deserved and the upper strand of a human TERC-targeted dubble extranded degeneration and sense extranged degeneration and sense extranged degeneration and sense extranged and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 siNA, which is identical to the c-fos transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      4.2%; Score 19; DB 1; Length 19;

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonuclectide and antisense oligonuclectide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates confaint of stressed from the tenderses genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and candor complants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis, infectious diseases (specifically protozoal), transplants rejection, or autoimmune or age-related diseases of sind, diagnosis, therapeutic carget identification and validation, can under emphing (e.g., of single nucleoride polymorphisms). The present sequence mapping (e.g., of single nucleoride polymorphisms). The present sequence Example 3; SEQ ID NO 279; 145pp; English.

The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are
                                                                                                                                                                                                                                                                                                                                                                                                             Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerses; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering nucleic acid; siNA; short interfering RNA; alkNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shrNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

ö
used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restencials, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence regressents the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthritic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; abhort hairpin RNA; shRNA; expression medulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERT; ss.

interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense cregions, or alternatively are assembled from a sense oligonucleotide specifically, the siNAs include short an antisense oligonucleotide. Specifically, the siNAs include short history (ShRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised. Commodiate expressed from a vector or enzymatically synthesised. The invention also relates to kits for the invitro or in vivo delivery of siNA, conjugates and/or complexes of siNA, and vectors that express siNA. The siNas are used to modulate expression of the telomerase genes in calls, tissue complexes of siNA, and vectors that express siNA. The siNas are used to modulate expression of the telomerase genes in calls, tissue complexes of siNA, and vectors that express siNA. The siNas are used for treating cancer, restencesis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, protozoal), transplant rejection, or autoimmune or age-related diseases, sin ultiple sclerosiss, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNas are also useful for drug screening, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TERC-targeted double-stranded signal.

Mcswiggen J, Beigelman L;

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and matisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA, and vectors that express since it since are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restencisis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus. AIDS, macular degeneration, skin ulcers and rheumatosid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, agenematic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiartitic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; aiRNA; double-stranded RNA; micro-RNA; miRNA; short hinterfering short hairbin RNA; short interfering copies to the specific double-stranded short; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (shRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain decoxribbonucleotides, and can be themically synthesised, can contain decoxribbonucleotides, and can be themically synthesised, can contain decoxribbonucleotides, and can be themically synthesised, can contain decoxribbonucleotides, and vectors that express sinA. The siNAs are cused to modulate expression of the telomerase genes in cells, tissue cand/or complexes of siNA, and vectors that express siNA. The siNAs are cused to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be cused for treating cancer, restenosis, infectious diseases (specifically protozoal), transplant rejection, or autoimmune or age-related diseases, ce.g. multiple sclerosis, lupus erythematosus, AIDS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening diagnosis, therapeutic target identification and validation, mapping (e.g., of single mucleotide polymorphisms). The present sequence mapping (e.g., of single mucleotide polymorphisms). The present sequence contains the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cytostatic; vasotropic; protozoacide; immunosuppressive; dermatological; neuroprotective; anti-HIV; ophthalmological; antiulcer; antirheumatic; antiarthitic; antiinflammatory; gene therapy; telomerase; human; terc; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNN; micro-RNA; miRNA; short halpin RNA; shrNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; TERC; TERT; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                     New short interfering nucleic acid downregulates expression of the telomerase gene useful e.g. for treatment and diagnosis of cancer.

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the one or more telomerase genes by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonuclectide and antisense oligonuclectide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the telomerase genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for transplant rejection, or autoimmune or age-related diseases, e.g. multiple sclerosis, lupus erythematosus, AlbS, macular degeneration, skin ulcers and rheumatoid arthritis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, agenetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human TERC-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New short interfering nucleic acid downregulates expression of the telomerase gene useful e.g. for treatment and diagnosis of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 19 BP; 1 A; 3 C; 10 G; 0 T; 5 U; 0 Other;

Designing and selecting short double-stranded oligonucleotides for treating viral infections, cancer and genetic or metabolic diseases, comprises using gene chip and protein chip microarrays to identify specific DNA sequences.

Example 1; Page 19; 58pp; English.

The invention relates to screening, identifying or predicting, and assembling 19-25 nt double-stranded oligonucleotides (termed short double stranded oligonucleotides, SDSO) as active pharmaceutical compositions for the treatment of viral infections, malignant tumours, and genetic and metabolic diseases, comprising screening and identifying a specific DNA sequence in an abnormal gene encoding a protein with gene chip and protein chip microarrays. The above method comprises screening the disease-causing genes, over-expressing in cells and/or tissues, with the abnormal gene encoding a protein or playing other comprised within the abnormal gene encoding a protein or playing other compositions of the protein or predicting efficacious 19-25 nt double-stranded oligonucleotides with a conformation of an RNA molecule and making sure that selected sequence is not localised within the stem-loop of target mRNA with any related software. Also included are pharmaceutical compositions of gene drugs (such as Dermogene, Dungone, Hepatogene, Loukogene, Lymphogene, Prostogene, Breastogene, Braintumogene and Skin-whitogene including but corous of specific 19-25 nt daRNA, 19-25 nt daRNA, and/or single-stranded RNA and/or NNA with the special pattern, 5'-cogaroup of specific 19-25 nt daRNA, 19-25 nt daRNA, and/or single-stranded RNA and/or NNA with the special pattern, 5'-cogaroup of specific la-25 nt daRNA, 19-25 nt daRNA, and/or single-stranded RNA and/or NNA with the special pattern, 5'-cogaroup of specific cell-targeting proteins and other active agents and additional materials) and a simplified method for predicting and selecting a meterials) and simplified method for predicting and selecting and additional

antisense oligonuclectide molecules or short interfering RNA (siRNA) (comprising identifying a special pattern that can be localised in any position of an oligonuclectide sequence evaluating the specificity of a selected sequence). The Short interfering RNA (siRNA) are targeted against genes involved in viral infection, malignant tumours, genetic and methodic diseases. The methods are useful for designing and selecting short double-stranded oligonucleotides as a gene drug that can specifically inactivate a group of corresponding genes. The composition may be used for treating diseases or disorders associated with abnormal expression of genes in cells or tissues of humans or animals, such as viral infections, cancer, or genetic or metabolic diseases. The present sequence is a target region for an SDSO from an human cDNA. specific and efficacious small double-stranded oligonucleotides (SDSO), \$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$

                                                                                                The invention relates to screening, identifying or predicting, and sembling 19-25 nt double-stranded oligonucleotides (termed short double stranded oligonucleotides, SDSO) as active pharmaceutical compositions cranded oligonucleotides, SDSO) as active pharmaceutical compositions cranded oligonucleotides, SDSO) as active pharmaceutical compositions for the treatment of viral infections, malignant tumours, and genetic and metabolic diseases, comprising screening and identifying a specific DNA sequence in an abnormal gene encoding a protein with gene chip and protein chip microarrays. The above method comprises screening the disease-causing genes, over-expressing in cells and/or tissues, with the disease-causing genes, over-expressing, identifying a specific DNA sequence within the assistance of computer and specific DNA composition of an RNA molter encoding a protein or playing other biological roles with the assistance of computer and specific DNA composition of an RNA molter encoding a protein or playing other composition of an RNA molter encoding a protein or playing other composition of an RNA molter encoding a protein or playing other composition of an RNA molter encoding a protein of gene drugs of the seatogene, branched are pharmaceutical compositions of gene drugs of specific 19-25 in dsRNA, 19-25 in dsRNA, 19-25 in dsRNA and or single or more pharmaceutical compositions of gene (or none), one or more pharmaceutical carriers, one or more pharmaceutical carriers of comparing deficient of a simplified method for praceficing and encoded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         expression of genes in cells or tissues of humans or animals, such as viral infections, cancer, or genetic or metabolic diseases. The present
                                                                                                                                                                                                                                                                                                                                                                                      Designing and selecting short double-stranded oligonucleotides for treating viral infections, cancer and genetic or metabolic diseases, comprises using gene chip and protein chip microarrays to identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        viral infections, cancer, or genetic or metabolic diseases. sequence is a target region for an SDSO from an human CDNA.

This invention relates to a novel method concerning prognostic markers associated with EGFR (epidermal growth factor receptor) positive cancer. Specifically, it refers to a gene expression profiling method that can provide a prediction as to whether a patient is likely to respond well to treatment with an EGFR inhibitor. The present invention describes the currentiative analysis of the expression level of the RNA transcript of at CRP17, LAMC2 or their products thereof. It further provides a cDNA microarray containing named genes that represent prognostic transcripts which are useful for determining whether a patient diagnosed with an EGFR capressing head or neck cancer or colon cancer exhibits elevated or decreased expression levels of these genes compared to normal. As such, these methods are also useful for prognosing or predicting the likelihood or cancer-attributable death or prognession, including recurrence and metastatic spread of a neoplastic disease, as well as drug resistance.

This oligonucleotide sequence is a PCR primer used to amplify a human PCR amplify a such; and a prognostic cancer marker, given in an
